```

Comments on the plot of the Prophet model forecasts:

The Prophet model appears to be a reasonable fit for the data. The forecasts produced by the Prophet model appear to capture the trend of the data in the test set (positive trend). Additionally, the forecasts produced by the Prophet model appear to have relatively low variance.

Comments on the Prophet model decomposition:

The Prophet model identified an overall positive trend, a weekly trend, and a yearly trend.

The overall trend shows that the value of the Dow Jones Index (DJI) has been generally increasing during the past 3 years, with the exception of a dip in the middle of 2022. This trend predicts that the value of the DJI will continue increasing over time. This is probably true - the value of the DJI will likely continue to increase along with rising inflation and increasing market caps of the stocks included in the DJI. However, it is always possible that the DJI will decrease due to war, natural disasters or other unforseen events. The trend identified by the Prophet model has no way of accounting for this.

The weekly trend shows that the closing price of the DJI is highest on weekdays and lowest on the weekends. This is due to the fact that the markets are closed on weekends and this trend is likely to continue indefinitely.

The yearly trend is the least appropriate of all trends identified by the Prophet model. There is no way of predicting that the value of the DJI will continue to increase or decrease in certain months as it has in the past.

```
# Calculating the sign correlation of the the daily closing price of the DJI

# Sign correlation function
rho.cal<-function(X)
{
    rho.hat<-cor(sign(X-mean(X)), X-mean(X))
    return(rho.hat)
}

# Calculating the sign correlation
rho_cal<-apply(as.matrix(DJI.ClosingPrice), MARGIN=2, FUN=rho.cal)

# Sign correlation value
rho_cal</pre>
```

DJI.Close ## 0.8067395

Comments on the sign correlation value:

The sign correlation value indicates that the daily closing price of the DJI during the dates specified above may follow a normal distribution.

Forecasting with an EWMA model

```
# Fitting an EWMA model using the ETS function
DJI.ets = ets(training.sample$DJI.Close)
summary(DJI.ets)
## ETS(A,N,N)
##
```

```
## Call:
    ets(y = training.sample$DJI.Close)
##
##

## 13686.80 13686.83 13700.68
##
## Training set error measures:
                   ME
                          RMSE
                                     MAE
                                                MPE
                                                          MAPE
                                                                    MASE
## Training set 7.543 317.1744 238.2268 0.01990846 0.7260493 0.9986979 0.00663868
```

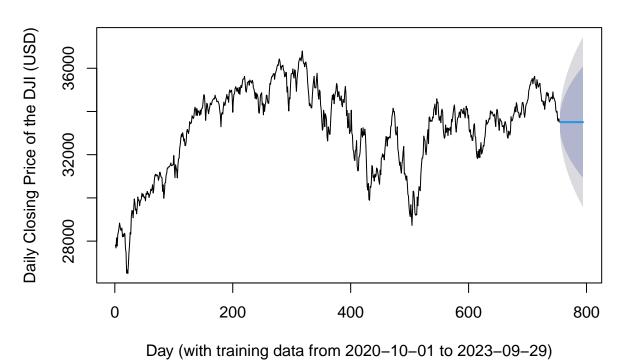

Comments on the EWMA(ETS) model:

The optimal alpha identified here is 0.9999.

The MASE value indicates that the ETS model performs marginally better than the naive model.

```
# Plotting the ETS model forecasts for the next 2 months
plot(forecast(DJI.ets, h=n),
    xlab = "Day (with training data from 2020-10-01 to 2023-09-29)",
    ylab = "Daily Closing Price of the DJI (USD)",
    main = "ETS Forecasts for the Daily Closing Price of the DJI")
```

ETS Forecasts for the Daily Closing Price of the DJI

Comments on the plot of the ETS model forecasts:

The ETS model forecasts appear to predict no trend in the test data and resemble the naive model forecasts. Additionally, The ETS model produces forecasts with a lot of variance.

Comparing the Prophet and ETS models

```
# Preparing the data to compare the Prophet and ETS models using fable

# Creating a date variable
DJI <- zoo::fortify.zoo(DJI)
DJI <- DJI %>% rename(c("Date" = "Index", "Close" = "DJI.Close"))

# Creating a tsibble object
DJI <- as_tsibble(DJI, index = Date)

# Re-indexing to remove the missing values
DJI <- DJI |>
mutate(day = row_number()) |>
update_tsibble(index = day, regular = TRUE)

# Creating the training set for the DJI
DJI.train2 <- DJI |> filter(yearmonth(Date) <= yearmonth("2023 Sept"))

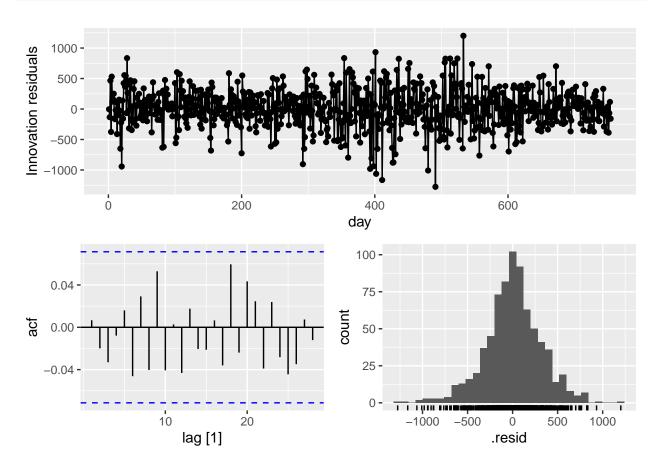

# Checking the training set
head(DJI.train2)</pre>

                                                                    6
```

ETS model residual diagnostics

```
# Fitting the ETS model
fit.ets <- DJI.train2 |> model(ETS(Close))

# Plotting the residuals
gg_tsresiduals(fit.ets)
```

Comments on the residual diagnostics of the ETS model:

The residuals for the ETS model resemble white noise. The ACF plot indicates no significant autocorrelation and the histogram appears centered around a mean of 0.

```
# Calculating the sign correlation of the ETS model residuals
rho_cal_ets.resid <-apply(as.matrix(resid(fit.ets)$.resid), MARGIN=2, FUN=rho.cal)
# Sign correlation value
rho_cal_ets.resid</pre>
```

[1] 0.750745

Comments on the sign correlation value:

The sign correlation value indicates that the residuals of the ETS model follow a t-distribution.

```
# Ljung-Box test for autocorrelation
augment(fit.ets) |> features(.innov, ljung_box, lag=10)
```

Comments on the Ljung-Box test:

The p-value is quite large, indicating that we fail to reject the null hypothesis and thus we may treat the residuals from the ETS model as white noise.

Prophet model residual diagnostics

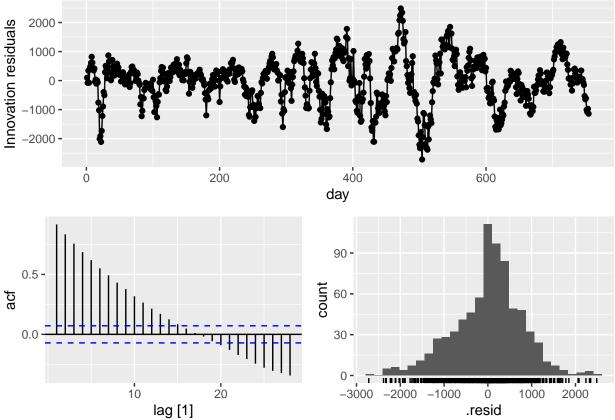

```
##
## Attaching package: 'fable.prophet'

## The following object is masked from 'package:prophet':

##
## prophet

## Fitting the Prophet model
fit.prophet <- DJI.train2 |> model(prophet(Close))

# Plotting the residuals
gg_tsresiduals(fit.prophet)
```

Comments on the residual diagnostics of the Prophet model:

The residuals for the Prophet model are clearly not white noise. The ACF plot indicates significant auto-correlation and the histogram appears to have a long left tail.

```
# Calculating the sign correlation of the Prophet model residuals
rho_cal_prophet.resid <-apply(as.matrix(resid(fit.prophet)$.resid), MARGIN=2, FUN=rho.cal)
# Sign correlation value
rho_cal_prophet.resid</pre>
```

```
## [1] 0.7635871
```

<chr>>

1 prophet(Close)

##

Comments on the sign correlation value:

<dbl>

2993.

<dbl>

0

The sign correlation value indicates that the residuals of the Prophet model follow a t-distribution.

Comments on the Ljung-Box test:

The p-value is 0, indicating that we may reject the null hypothesis and thus the residuals are not white noise.

Further comparisons of the Prophet and ETS models

```
# Fitting both the Prophet and ETS models using fable
DJI.fit <- DJI.train2 |>
   model(
    ets = ETS(Close),
    prophet = prophet(Close)
)

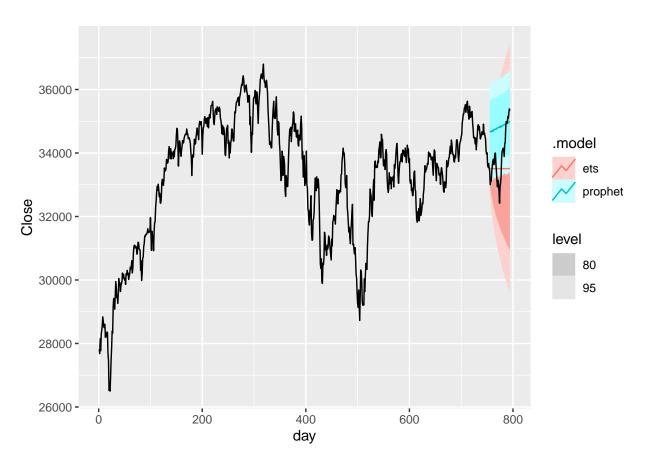

# Comparing the training set accuracy of both the Prophet and ETS models
accuracy(DJI.fit)
```

```
## # A tibble: 2 x 10

```

The ETS model is better on all values except for ME.

```
# Comparing the accuracy of forecasts from the ETS and Prophet models
DJI.fc <- DJI.fit |> forecast(h = n)
DJI.fc |> accuracy(DJI)
```

Again, the ETS model appears to be better on all values.

When comparing both models together on the plot, it is clear the Prophet model produces forecasts with less variance than the ETS model. The Prophet model forecasts also appear to capture the trend of the data more accurately. However, the residual diagnostics from the Prophet model showed that there was a significant amount of variation which was not captured by the model. The residuals showed a strong pattern and had significant autocorrelation. The ETS model was also better on all measures of accuracy

Overall, I would choose the ETS model to make forecasts over the Prophet model.
